EXTERNAL EVIDENCE

A frozen bilateral baseline replicates on PAPILA

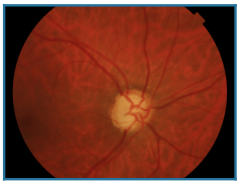

PAPILA is a locked glaucoma-cohort test; CFP–OCT is a separately labeled development stress readout.

A New imaging cohort

PAPILA · 244 complete bilateral patients

OS · left eye

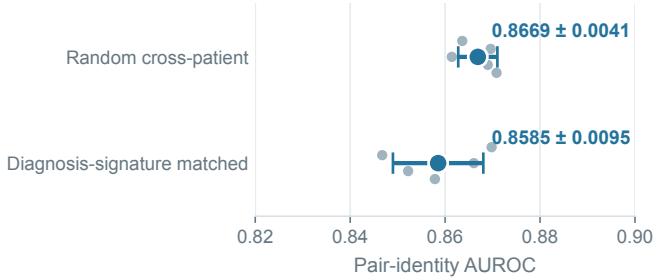

OD · right eye

Illustrative patient RET014; selected without using scores

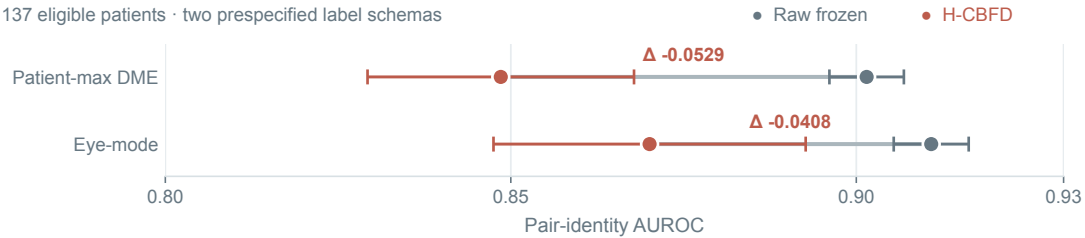

B Frozen external result

ImageNet ResNet-50 · one image per eye · no tuning

C CFP–OCT: learned-candidate stress test

Exploratory · 137 eligible patients · two prespecified label schemas

PAPILA tests the frozen raw representation. H-CBFD was not evaluated on PAPILA.
