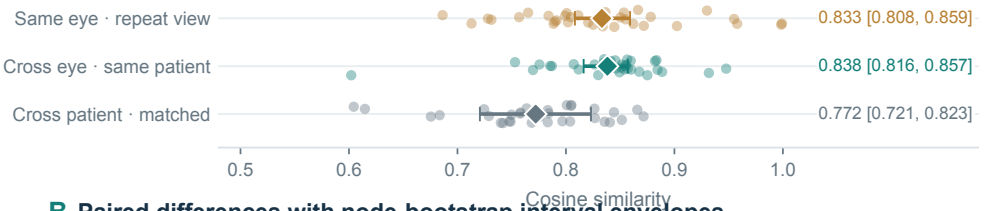
FOUR-VIEW HIERARCHY

Cross-eye correspondence under stricter matching

Exact ordered bilateral DR signature and right-eye quality tier; patient-node uncertainty, conditional on fixed assignments.

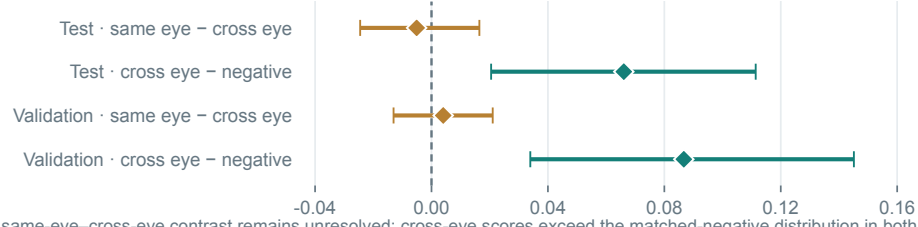
A Test-patient score distributions

DeepDRiD · 33 eligible test patients · identity-free patient scores



B Paired differences with node-bootstrap interval envelopes

Each envelope spans the five assignment-specific 95% patient-node bootstrap intervals; not a pooled interval.



The same-eye–cross-eye contrast remains unresolved; cross-eye scores exceed the matched-negative distribution in both splits.
