TRANSFER BOUNDARY

External baseline signal; learned-head transfer remains unresolved

PAPILA evaluates the frozen raw baseline only; H-CBFD is assessed on source-domain and already-inspected stress data.

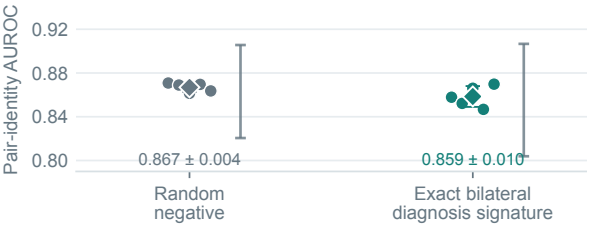

A PAPILA examples

Representative OD/OS source images.

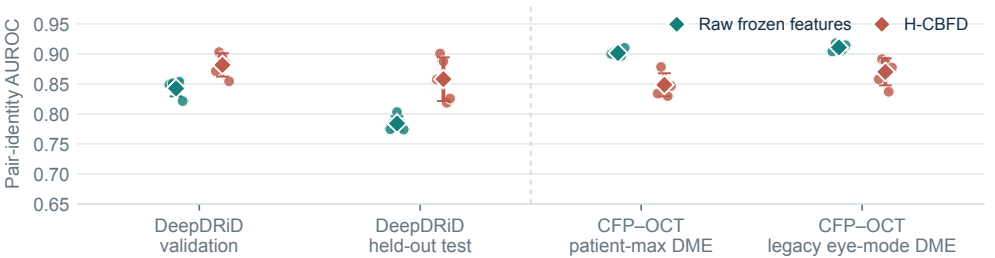

B Frozen baseline on PAPILA

n=244 · no PAPILA tuning.

C H-CBFD candidate: internal comparison does not guarantee transfer

Mean ± corrected across-seed sample SD; five fixed negative assignments per condition.

CFP–OCT was inspected during development; PAPILA was not used to assess H-CBFD. Error bars in C show across-seed SD, not patient-sampling confidence intervals.
